Quaternary units are not shown except for landslides (map unit Qls).

Faults define the edges of the map area and the location of the western edge of the Copperopolis 7' x 7' Quadrangle.

Allochthonous units are not shown except for Landslide (map unit Qls).

The landslides are characterized by large areas of partially intact bedrock, and/or landslide deposits within the map area.

The map area is largely composed of Triassic to Jurassic sedimentary rocks, including fine-grained sandstone, siltstone, and mudstone, as well as volcanic rocks such as basalt, andesite, and rhyolite.

The map area is located in a region of the Earth's crust that experienced significant tectonic activity during the Mesozoic and Cenozoic eras, resulting in the formation of large fault systems and folds.

The map area is characterized by a variety of rock types, including sandstone, siltstone, mudstone, basalt, andesite, and rhyolite.

The map area is underlain by a variety of rock types, including sandstone, siltstone, mudstone, basalt, andesite, and rhyolite.

The map area is characterized by a variety of landforms, including mountains, valleys, and basins.

The map area is located in a region of the Earth's crust that experienced significant tectonic activity during the Mesozoic and Cenozoic eras, resulting in the formation of large fault systems and folds.

The map area is characterized by a variety of rock types, including sandstone, siltstone, mudstone, basalt, andesite, and rhyolite.
