ACKNOWLEDGEMENT

The author wishes to express appreciation to the copper mining companies for providing production data.

Additionally, thanks are extended to Michael N. Greeley, Field Engineer and Nyal Niemuth, Mineral Resources Specialist, Arizona Department of Mineral Resources for their valuable advice and assistance in the compilation of some of the contained tables.

To John H. Jett, Director, ADMR, appreciation for the opportunity to compile data relative to Arizona's copper industry in 1982 and present it in convenient form.

INTRODUCTION

The Arizona Department of Mineral Resources presents herein a report covering activity in Arizona's Copper industry in the calendar year 1982. A brief review of operational highlights reported by the major developers and producers in the State, market and price developments which affected copper production and discussions of Arizona inventory and severance taxes on metalliferous minerals are included.

The statistical tables in this report include various production and employment figures for 1982. Production of recoverable copper is given for individual mines and by company. Figures showing the importance of copper in the state's mining industry are furnished, as are data on the by-products of copper mining; gold, silver and molybdenum. In addition, historical compilations are included for leach copper, average grade of ore produced, percent copper recovered, open pit mine stripping ratios, and employment and earnings. Additional compilations indicating refined copper inventories in and out of the United States and average copper prices by month from 1973-82 are provided. Also included are tables showing designed mine capacity and copper reserves in Arizona.

The Department maintains an extensive reference library concerning the copper industry in Arizona. This includes information on individual mines and mining companies, United States Bureau of Mines and United States Geological Survey publications, professional publications, and earlier editions of this report.

COPPER PRODUCTION IN ARIZONA--1982

Arizona, in spite of production curtailments, continued to lead the nation in the production of copper. In 1982 the state's mines produced 842,650 tons of recoverable copper, down 27% from the record 1981 production. This, however, was 67.2% of the United States total (Table XIV).

In 1982, the gross value of mineral production (excluding coal, natural gas and petroleum) in Arizona was \$1,619,296,000. Of this total, copper production contributed almost 78% (Table X). Other major contributors to the total value of mineral production in the state included molybdenum, gold and silver. Virtually all the molybdenum and most gold and silver are byproducts of the treatment of copper ores (Table X). As a result, Arizona ranks second in the United States production of silver and molybdenum, and fourth in the production of gold.

Copper was produced from 21 major Arizona copper mines in 1982. Molybdenum was recovered as a by-product at 11 of the copper mines during the year (Table I). Nine mines produced 78.73% of Arizona's 1982 copper production and five mines produced 91.80% of the molybdenum. The two largest producers, Twin Buttes and Morenci, first and second respectively, accounted for more than 27% of the total copper recovered. The Sierrita mine was by far the largest producer of by-product molybdenum recovering 42.34% of the state's total (Table IV).

Copper produced by leaching methods during 1982 was 334.5 million pounds, down 5% from 1981 record production, and accounted for 19.6% of total primary production (Table II). A major addition to leach copper production was the increased output at the Lakeshore mine.

There were seven solvent extraction electrowinning operating in Arizona in 1982. Solvent extraction uses a liquid ion-exchange process to increase the copper concentration of the solution from which the copper is then recovered by electrolytic deposition. Some of the advantages of the solvent extraction process over the cementation process are: no air pollution is produced, there is a net reduction in energy costs, and the end product is high grade cathode copper which can be marketed directly.

There were thirteen open pit copper mines operating in the state in 1982. The stripping ratio, or the amount of waste removed compared to the amount of ore mined, at these operations is given for the past decade (Table IX). The low 1982 weighted average stripping ratio (1.31:1) reflects producers' efforts to reduce mining costs by stripping no more waste than necessary to maintain production. In the future stripping ratios can be expected to increase when the copper market recovers and mining operations become profitable.

Copper sulfide ores were the source of 80.4% of the copper produced in 1982. The average grade of that sulfide has trended slightly downward during the last decade (Table VII). In 1982 a ton of average ore contained 11.8 pounds of copper. That was down less than 10% from 1972 when the average ton of ore contained 12.8 pounds of copper.

Table XIII shows an estimate of the capacity to produce primary copper at each of the state's principal operations. Total estimated design capacity is 1.248 million tons annually. The Arizona mines, their concentrators and leach plant facilities, operated at 68% of estimated capacity during 1982.

Copper Production in Arizona Continued

Employment in Arizona's copper industry was 17,182 persons during 1982. That was a decrease of 34% from the previous year and the lowest number since 1968 (Table XV). However, worker productivity and average hourly earnings increased. The aggregate man-hours worked dropped 35%. The Arizona production worker's average hourly production of ore was 6.064 tons, 0.25 tons more than in 1981, while the average hourly production of copper was 70.44 pounds, an increase of 8.89 pounds. Earnings of the production workers rose \$0.87 to an average hourly rate of \$12.94, an increase of 7% (Table XVII).

Affecting production at Arizona's copper mines in 1982 were some events largely beyond the producing companies' control. The world-wide recession caused demand and prices for copper to fall. Aggravating the situation was foreign government owned CIPEC (Council of Copper Exporting Countries) producers who produced as much copper as they could, without regard for market conditions. CODELCO, the Chilean state company, for instance, increased its output by 15% to an all-time high. It then received from the International Monetary Fund compensatory financing facility \$327 million to compensate for its alleged loss in export revenues because of copper's low price. United States copper producers were caught in a cost price squeeze due to their higher labor costs, lower ore grades and heavy environmental burdens. Thus, U.S. producers were forced to bear a disproportionately large share of the production curtailments.

Many factors, some of which have been discussed above, affect the actual production of copper in Arizona. Most technological factors are so interwoven that to isolate one and describe its impact is extremely difficult and often misleading. An even more difficult task is to properly evaluate the rapidly enlarging domain of economic and socio-political factors that influence daily the decisions made by the developers and producers of copper. Foremost in any discussion of capacity is the availability of the natural resources; in this case the availability of deposits of copper mineralization. A listing of most of Arizona's rich endowment of proven copper reserves is given in Table XX.

It should be emphasized that although the reserves listed in Table XX total of 9.5 billion tons of ore, the figures can move upward or downward drastically with changes in technological skills or with changes in U.S. policy or economy. If, for example, socio-political factors such as capricious rules and regulations imposed by governments become too burdensome, many of these deposits may never be developed and many existing mines may be closed. One must never lose sight of the fact that the term "ore" is not a geological or mineralogical term but purely and simply an economic term. If rock containing a marketable commodity can be mined, processed, transported and the commodity marketed at a profit then the rock from which the commodity was derived is ore, -if not, it is mineralized waste. Some copper mines have been producing and selling copper for prices under cost because it is more economical to maintain some production than to mothball the operations and lose employees.

A BRIEF REVIEW OF THE 1982 COPPER MARKET

"Free World consumption of copper weakened steadily throughout 1982. In the United States, industrial production in terms of capacity utilization declined to post-World War II lows due to the continuing economic recession. For the third consecutive year, demand for copper from the housing and automotive industries, which account for 40% of U.S. copper consumption, was at sharply reduced levels. Total U.S. consumption of copper in 1982 declined 17% from 1981".

"In response to weak demand, copper producers in the U.S. and Canada closed or curtailed many mining operations. The consequent loss of mine output in 1982 amounted to more than 500,000 tons of copper, or about 25% of normal production in these two countries. Producers in other countries, however, did not cut back. In fact, copper mine output increased in some countries where the perceived need to maintain employment and to export copper for foreign exchange outweighed market considerations. As a result, the decline in Free World copper output did not match the drop in consumption, and visible copper stocks increased by more than 300,000 tons".

"Copper prices reacted to the worsening market by falling below the already unremunerative levels of 1981. The average domestic producer price for 1982 was 72.6 cents a pound compared to 83.7 cents in 1981".

"As 1982 drew to a close, the steady decline in interest rates which had started at midyear began to stimulate improved demand for houses and automobiles, & copper prices increased slightly. Although stocks held by producers and the commodity exchanges increased significantly in 1982, they were still far below the levels reached in 1977-78. Consumer inventories were at minimum levels".

"The supply of copper in 1983 is not likely to exceed 1982 levels. Substantially higher copper prices than those prevailing at the end of 1982 will be required to restore fully the cutbacks in copper mine output which occurred in 1982 in North America and to prevent additional mine closings. Refined copper production will continue at reduced levels as the cutbacks in mine production work their way through the pipeline. Overseas producers were already producing about at capacity in 1982 and have no major new mines coming on stream in 1983".

Source: ASARCO Incorporated Annual Report 1982.

HIGHLIGHTS OF COMPANY OPERATIONS IN ARIZONA

ANAMAX MINING COMPANY

Anamax Mining Company is an equal partnership between Anaconda Minerals Company, a wholly owned subsidiary of the Atlantic Richfield Company and AMAX Incorporated. The company operates the Twin Buttes open-pit mine and controls the Palo Verde ore reserves under a lease from the State of Arizona. An agreement is in effect with ASARCO Incorporated for mining the Palo Verde deposit. Anamax is an equal partner with ASARCO in the Eisenhower Mining Company which mines the Palo Verde deposit. Anamax's share of Eisenhower ore is processed at the Twin Buttes mill.

"Under the terms of a consent order issued by the Federal Trade Commission on October 29, 1979 in an administrative proceeding in which it had challenged the acquisition of common stock of The Anaconda Company by Atlantic Richfield and the subsequent merger between the companies, the Company is required to divest most of its interest in Anamax by October 1984 and has been seeking a buyer for its interest. The company's share of the Twin Buttes and Palo Verde mines production yielded 69,600 tons of copper in 1982 and by-products of molybdenum, silver and uranium. Anamax Mining Company suspended sulfide mining at the Twin Buttes mine on January 31, 1983. The Company's (Atlantic Richfield) annual share of Anamax's copper production will be reduced by approximately 50 percent as a result of the suspension".^{1/} Anamax Mining Company was the largest Arizona copper producer in 1982 raising its all-mines production by 7.5% from the 1981 figures to 290,579,000 pounds of recoverable copper. Pounds of recoverable molybdenum increased 86.8% to 4,136,000 from 1981 production making it second only to the Duval Corporation.

ASARCO INCORPORATED

ASARCO owns and operates four open pit mines in Arizona: Mission, Sacaton, San Xavier and Silver Bell. The Silver Bell mine was closed in December 1981 and remained shut down all of 1982 except for a small copper leaching operation. The Eisenhower open pit mine is operated and partially owned by ASARCO. The company's share of Eisenhower ore is processed with ore from the San Xavier and Mission mines at the Mission concentrator. Other ASARCO operations in the state include a smelter and acid plant at Hayden and the development of an underground project at Sacaton. Because of high development costs and a weak copper market work on this mine was suspended in September 1981 and remained shut down throughout 1982. For the same reason the company emphasized cost reduction throughout its organization during 1982. Through a combination of attrition and a series of layoffs, the Mission Unit (Mission, Eisenhower and San Xavier mines) reduced employment by 24%. However, copper output remained at the 1981 level by alterations in the mining plan, increased productivity and the shut down of the molybdenum plant in July because of low prices and demand.

Work is continuing on a \$132.6 million project at Hayden, AZ to install a modern oxygen flash smelting furnace which is scheduled to start-up in October 1983. This will replace Hayden's two reverberatory furnaces and the roaster. Demolition of the larger reverberatory furnace was commenced in November 1982 to make room for the new oxygen furnace. Since this furnace will have a sulfur dioxide discharge gas suitable for conversion to sulfuric acid a new acid plant was substantially complete by the end of 1982. A plant to produce oxygen for the furnace was 40% complete by year-end and a facility to remove solid particles from the

-continued-

^{1/} Atlantic Richfield Annual Report on 10-K, 1982. pp 7-8

furnace emissions was 60% complete.

CASA GRANDE COPPER COMPANY

The Casa Grande Copper Company was formed to explore and develop the Casa Grande deposit which is four miles northwest of Casa Grande, AZ and reportedly contains 350 million tons of ore grading about one percent copper. It is equally owned by Hanna Mining Company and the Getty Oil Company. Hanna Mining is the operating partner.

Operations were suspended in 1981 reflecting the recession and the worsening copper market. When work is resumed, a pilot program will be undertaken to provide data for further engineering and feasibility studies.

Development of the ore body could require an investment of at least \$400 million.

CITIES SERVICE COMPANY

On December 1, 1982 Newmont Mining Corporation agreed to purchase Cities Service Company's Miami Copper operations, 80 miles east of Phoenix and includes the Pinto Valley open pit mine, The Miami East underground development, and two solvent extraction-electrowinning plants. The company's new name became the Pinto Valley Copper Corporation and its largest producer has been the Pinto Valley open pit mine where copper ore is treated at a sulfide concentrator. Dump leaching is done at the Copper Cities mine and in-place leaching at the closed underground Miami mine. The Copper Cities precipitation plant shutdown June 1, 1982 and the Pinto Valley mine and mill on June 29, 1982. Development work at the Miami East ceased on June 27, 1982. Concentrates from the former Cities Service properties have provided 70% of the feed for the Inspiration Consolidated Copper Co's smelter. This contract will expire in the third quarter of 1984 when the Pinto Valley Copper Corp. concentrates will be smelted by Newmont's Magma Copper Company unit at San Manuel.

Because of shut downs total production of pounds recoverable copper dropped from 184,458,000 in 1981 to 113,695,000 in 1982.

CYPRUS MINES CORPORATION

Cyprus Mines Corporation is a wholly owned subsidiary of the Standard Oil Company of Indiana. Cyprus' operations include the Bagdad and Johnson open pit operations and the Cyprus Metallurgical Processes Corporation in Tucson.

During 1981 Cyprus Mines Corporation acquired Union Oil's 25% interest in the Pima Mine. Cyprus Mines now owns 75.01% of Pima with Utah International (wholly owned by the General Electric Company) remaining the sole non-operating partner with a 24.99% share.

Depressed metals prices resulted in production cutbacks in Arizona copper mines in 1982. All mining and milling operations were halted October 1, 1982 at Cyprus Pima. Equipment was mothballed to permit reopening when conditions get better.

-continued-

Cyprus Bagdad, the corporations' largest copper mine, instituted cost control measures including a reduction in stripping operations together with a production cutback of 10% for the last half of 1982. Additionally a wage and hiring freeze was instituted.

DUVAL CORPORATION

Duval is a wholly owned subsidiary of the Pennzoil Company. Duval's operation consists of the Esperanza and Mineral Park open-pit mines, concentrators and precipitation plants, the Sierrita open-pit mine and concentrator, a ferromolybdenum plant at Esperanza and the CLEAR (Copper Leach, Electrolysis and Regeneration) plant adjacent to Sierrita which utilizes non-polluting hydrometallurgical technology to turn copper concentrate into high grade crystals (equivalent to a high-grade blister copper) electrolytically. In 1982 Duval began installing some uniquely designed low-energy electrolytic cells at the CLEAR facility which promise to save energy, cut maintenance costs and improve purity of the finished product.

During 1982 Duval's two smallest copper/molybdenum mines (Esperanza and Mineral Park) were closed and produced only precipitate copper. Sierrita which had been shut down since December 14, 1981 was reopened April 1, 1982 at reduced production rates and with a greatly reduced work force.

An innovative movable ore crushing and conveying system was developed and started up at the end of 1981 at the Sierrita property. The system, which is the United State's first large-capacity movable crushing system, can be moved to various sites within the pit by a track-type transporter as mining progresses. Crushed ore is then carried out of the mine by a conveyor system rather than trucks, resulting in a reduction in cost.

EISENHOWER MINING COMPANY

The Anamax Mining Company and ASARCO Incorporated are equal partners in the Eisenhower Mining Company which was formed to develop the Palo Verde deposit. Mining of the deposit under the joint venture agreement is expected to reduce operating costs greatly for both companies and to lengthen the life of the Mission and San Xavier mines significantly by eliminating some pit slopes and recovering ore that would ordinarily have to be left along property lines. The agreement contains provisions governing the amount of ore each partner will receive, the timing of ore delivery, and allocation of costs between the partners.

ASARCO is the mine operator and its share of the ore is processed into concentrates at the Mission mill. Anamax's share of ore is crushed near the mine and sent 6¼ miles on a conveyor to be processed at the Twin Buttes mill. During 1982 Anamax received 4,683,000 tons of copper ore from Eisenhower and produced 27,218 tons of copper. Operator ASARCO received 2,122,800 tons of copper ore from Eisenhower from which it recovered 13,786 tons of copper.

INSPIRATION CONSOLIDATED COPPER COMPANY

The financial lineage of the Inspiration Consolidated Copper Company is somewhat complex. To quote from the proxy statement and information circular for the annual and special meeting of shareholders of the Hudson Bay Mining and Smelting Co., Ltd. (HBMS) held June 8, 1983 in Toronto, Ontario, Canada: "At the present time HBMS' significant interests consist of its Canadian Metals division and its 50% interests in Inspiration Resources which is headquartered in the United States, and Trend, which has operations in the United States and Indonesia. Inspiration Resources owns all the common shares of Inspiration Coal, Inspiration Copper (author's underscore) and Terra which operate in the United States. Minorco (Minerals and Resources Corporation Limited) owns the remaining 50% of both Inspiration Resources and Trend, and also owns, through Mincan (Minorco Canada Limited), approximately 44% of HBMS". A structural reorganization is contemplated in the near future.

The company's operations in the Miami area include the Inspiration area open-pit mine (Joe Bush, Live Oak, Red Hill and Thornton), a concentrator, a ferric cure leaching solvent extraction electrowinning plant, the Ox Hide mine's precipitation plant, the Inspiration smelter and acid plant. Operations at the Christmas mine which includes an open-pit mine and concentrator closed January 2, 1982 for an indefinite period. The mine, which had employed 250, had reopened in 1979 after being closed for two years.

"Production of copper from Inspiration Copper's mines decreased marginally from 125.9 million pounds in 1981 to 123.9 million pounds in 1982. This comparable production was achieved despite the closure of the Christmas Mine, which produced 17.8 million pounds in 1981. Considerable improvement was achieved in reducing unit costs per pound of copper produced due to a combination of increases in productivity, reduction in the wage and salary work force and decreased consumption materials. Increases in depreciation charges and interest expense partially offset the effect of these cost reductions".^{1/}

Additionally Inspiration Copper added an on-line computer system which will be useful in improving management access to needed information and accounting methods. Also, the engineering, maintenance and construction supervision have been consolidated into one department to improve efficiency.

KENNECOTT MINERALS COMPANY

In 1981 the Kennecott Corporation became a wholly owned subsidiary of the Standard Oil Company of Ohio (Sohio). Sohio, in turn, is 53% owned by a subsidiary of the British Petroleum Company.

The Ray Mines Division (Arizona) of Kennecott includes an open-pit mine, a sulfide concentrator, a solvent extraction-electrowinning plant, a dump leaching operation and precipitation plant, a pyrometallurgical smelter and a sulfuric acid plant. Mining at the Ray Mines Div., was suspended May 2, 1982 and remained shut down the remainder of the year.

"Chino Mines, A Kennecott-Mitsubishi partnership in New Mexico and Ray Mines in Arizona, each with about 50% of Bingham's (Kennecott's huge Bingham Canyon Mine near Salt Lake City, Utah) capacity, rank fifth and sixth, respectively, among domestic copper mines. Production capability from these three mines make Kennecott the largest copper producer in the United States and the fourth largest in the free world".^{2/}

-continued-

^{1/} Hudson Bay Mining & Smelting 1982 Annual Report p 8

^{2/} Sohio Annual Report, 1982, pp. 27-28

Kennecott Minerals
Continued

"Kennecott responded in several ways to the deteriorating market conditions. In March (1982) the company changed its copper pricing terms from a Comex-based price to a posted list price to improve its market flexibility. Costs were decreased at all of the company's operations, with proportionate work force reductions among salaried and hourly employees. In addition, the pay of salaried employees was reduced by 10%." 1/

MAGMA COPPER COMPANY

Magma is a wholly owned subsidiary of Newmont Mining Corporation. Magma operates two underground mines, San Manuel and Superior, with a concentrator at each. Also located at San Manuel are a smelter, a sulfuric acid plant, an electrolytic refinery and a continuous rod casting plant. These facilities operated at a reduced rate in 1982.

Magma suffered continuing losses in 1982. In view of depressed metal prices and low demand the company, in March 1982 reduced production at San Manuel to about 55,000 tons of ore per day and mine development was cut back. Both the Superior and San Manuel had work week reductions. "On April 14, 330 salaried and hourly rated employees at the San Manuel Division were laid off, and later in the second quarter, approximately 650 additional employees were laid off. On August 15, the higher cost Superior Division operations were suspended, and the mine was placed on an indefinite standby basis, resulting in the layoff of approximately 1,250 employees. By year end, approximately 2,400 of the 6,100 employees normally employed by Magma Copper Company were on layoff". 2/

"At the San Manuel Division, the mine produced 18,204,000 tons of ore at an average grade of 0.66 percent copper, compared with 22,198,000 tons with somewhat lower grade in 1981". 3/

"The Superior Mine produced 638,889 tons of ore at an average grade of 4.32 percent copper prior to the suspension of operations in August, as compared with 1,022,000 tons with a somewhat higher grade in 1981". 4/

"Year end inventories of saleable copper were 41 million pounds, compared with 32 million pounds at the end of 1981". 5/

Development work on the Kalamazoo project was suspended in late 1981. This ore body is adjacent to and deeper than the San Manuel deposit.

NORANDA LAKESHORE MINES, INC.

Noranda Lakeshore Mines, Inc., is a wholly owned subsidiary of Noranda Mines Ltd., of Canada. The mine is located 28 miles southwest of Casa Grande, Pinal County, on the Papago Indian Reservation. All underground development was suspended in April 1982. Two hundred employees were laid off at that time. The oxide ore body was the production zone. Noranda Lakeshore Mine treated 1,668,000 tons of

-continued-

1/ Sohio Annual Report, 1982, pp. 27-28

2-5/ Newmont Mining Corporation Annual Report, 1982. p. 10

Noranda Lakeshore Mines, Inc.
Continued

ore and recovered 22,800 tons of cathode copper in 1982 as compared with 1981 production of 1,767,000 tons of ore and 13,035 tons of copper. A surface vat leach and solvent extraction-electrowinning plant recovered the copper.

"A successful test program resulted in the development and construction of a full scale in-situ leach facility designed to extract copper from the broken low grade oxide ore remaining from the mined out block cave operation. Construction and equipment installation are complete and solutions will be introduced in early 1983 when sufficient injection holes have been drilled".^{1/} Old workings on the 1100 level and below were prepared for the initial leaching. Two 900 horse-power pumps were installed to transfer solutions from collection sumps and dams to the surface for distribution to the SX-EW plant.

PHELPS DODGE CORPORATION

Phelps Dodge has five operating units in Arizona: 1. The Morenci Branch includes the Metcalf and Morenci open-pit mines and concentrators, a dump leaching and precipitation plant, the Morenci smelter and acid plant. 2. The New Cornelia Branch (Ajo) includes an open-pit mine, a concentrator, a smelter and acid plant. 3. The Copper Queen Branch at Bisbee consists of leaching activities at the Lavender Pit, underground mines and dumps, and a precipitation plant. 4. The Douglas Reduction Works operates a smelter with a rated capacity of 700,000 tons per year of input material. 5. The Safford Branch is developing an underground mine ten miles north of Safford.

As a result of the recession, all Phelps Dodge copper mines, concentrators and smelters (except the Hidalgo, New Mexico smelter) were closed in April 1982. The largest of the copper production facilities---Morenci---resumed operations in October "--mining at the Metcalf pit, which had been suspended at the end of 1980, was resumed to exploit a substantial tonnage of ore that could be mined with a lower waste stripping ratio than usual. When mining of that ore has been completed, operations in the Metcalf pit will be suspended again, probably until 1988, and both the Metcalf and Morenci concentrators will be supplied solely from the Morenci pit." ^{2/}

New 1000-cubic foot flotation cells were continued to be installed at the Morenci concentrator in 1982 to replace the smaller older cells. The Ajo concentrator received similar cells during 1982 but on a more limited basis. The larger cells are more efficient and improve copper recovery and lower unit production costs.

The Copper Queen branch at Bisbee recovered minor amounts of precipitate copper by leaching some low-grade dumps at the permanently shut-down Lavender Pit mine.

During 1982, production at the Douglas smelter was intermittent and greatly under rated capacity. It ceased operations in April along with the rest of Phelps Dodge operations but resumed operation on a reduced basis in mid-July

and again shut down in early November, because its principal source of concentrates, the Cyprus Pima mine, suspended production in September. The Morenci smelter resumed production in mid-October after the reopening of the mine.

"The company suffered a net loss of \$74.4 million in 1982, the first loss incurred since the depression years of 1932 and 1933. With the shutdown of the Phelps Dodge Arizona operations during most of 1982, the company's total production in the State dropped to 126,800 tons of copper, as compared with 233,800 tons in 1981 and 176,500 tons during strike-ridden 1980". 1/

RANCHERS EXPLORATION AND DEVELOPMENT CORPORATION

The Bluebird mine, located a few miles west of Miami, Gila County, Arizona is owned and operated by Ranchers Exploration and Development Corporation. This open-pit copper mine suspended active excavation in July 1981, but some copper was recovered in 1982 by the sulfuric acid leaching of pre-existing oxide ore heaps and running the pregnant solutions through a solvent extraction-electrowinning plant. In October 1982 the leaching operation was placed on standby.

For the future, Ranchers is considering converting the Bluebird mine to an in-situ leaching operation when metal prices and market demands permit. The approach under consideration would involve hydraulic fracturing of the deposit, in place leaching with sulfuric acid, collecting the copper bearing liquid in bore holes and pumping it to the existing solvent extraction-electrowinning plant for cathode production. A pilot operation would be required first and full scale production would probably not occur before 1984.

SEVERANCE TAX ON METALLIFEROUS MINERALS

BACKGROUND

Laws of 1982, Chapter 230 repealed the tax on sales of metalliferous minerals and enacted a severance tax in its place. Under the provisions of the severance tax, metalliferous minerals were to be taxed at the time of production, not at the time of sale. All metalliferous minerals produced after 1982 were to be taxed on the greater of the following two values:

1. The "weighted mineral value" which is essentially the cost of extracting the minerals from the earth and delivering them to the site where they will be processed, or
2. A specified percentage of the old sales tax base.

The severance tax was to be levied on metalliferous minerals at a rate of 2-1/2 percent. Unless otherwise provided by law, the tax was to be administered in the same manner as the sales tax. As a result, severance tax payments were due on the first day of the second month following the month in which the tax accrued. From January 1, 1983 through June 30, 1983, 40 percent of the severance tax was to be distributed in the same manner as the transaction privilege tax (i.e. 25 percent to the cities, 33.6 percent to the counties and 41.4 percent to the state). In subsequent fiscal years, a progressively larger share of the severance tax was to be distributed in the same manner as the transaction privilege tax. The balance of severance tax collections, after making this distribution, was to be deposited each year in the state's general fund. (effective from and after December 31, 1982)

Laws of 1983, Chapter 4 changed the due date for payment of the Severance Tax to the twentieth day of the month following the month in which the tax accrues. Taxes were to be delinquent if not received by the Department of Revenue on the day preceding the last day of the month in which they were due. (effective April 1, 1983) The law also changed the interest rate on delinquent tax payments to equal the rate established by Section 6621 of the Internal Revenue Code, compounded annually. (effective February 11, 1983)

LEGAL CITATION

A.R.S. 42-1461 - 42-1466

PAID BY

Persons engaged in the business of extracting substances from the earth that become metalliferous mineral (A.R.S. 42-1462, 42-1461).

EXEMPTIONS

None.

Severance Tax on Metalliferous Minerals (Continued)

TAX BASE

The severance tax is levied on the "net severance base" of all metalliferous minerals produced after 1982. (42-1462) The "net severance base" is the greater of the following two values (42-1464, Laws of 1982, Chapter 230, Section 12):

1. The "weighted mineral value", or
2. A specified percentage of the old sales tax base (the gross value of production less out-of-state processing costs). This value will be referred to as the "Arizona value" after June 30, 1985.

The "weighted mineral value" is essentially the cost of extracting the minerals from the earth and delivering them to the site where they will be processed. The "weighted mineral value" is determined using the following formula (42-1464):

$$\text{weighted mineral value} = \frac{\text{mining costs}}{\text{total production costs}} \times \text{gross value of production}$$

where:

mining costs represent the cost of extracting the minerals from the earth and delivering them to the site where they will be processed further (42-1461).

total production costs include most of the major costs incurred in mining and processing minerals until the point of sale (42-1461).

gross value of production is determined by multiplying the recoverable units of a metallic product by the per unit price of the product; the price per unit does not include the cost of manufacturing, fabricating or otherwise transforming a refined mineral product, when these activities occur prior to sale of the product (42-1461).

Although metalliferous minerals will no longer be taxed on the old sales tax base, the value of minerals produced after 1982 may not fall below a specified percentage of the old tax value. (42-1464, Laws of 1982, Chapter 230, Section 12) The old tax value included not only the cost of extracting the minerals from the earth, but most of the major in-state costs of producing the minerals. This value was determined by multiplying the recoverable units of a metallic product by the per unit price and deducting the out-of-state processing costs from the result. (42-1464; Laws of 1982, Chapter 230, Section 12; 41-1461) The table below shows the minimum percentage of the old tax value that may be assigned to minerals for severance tax purposes. (42-1464; Laws of 1982, Chapter 230, Section 12):

<u>period during which minerals are produced</u>	<u>minimum value of minerals for purposes of determining the severance tax</u>
January 1, 1983 - June 30, 1983	100% of the old taxable sale value
July 1, 1983 - June 30, 1984	83-1/3% of the old taxable sale value
July 1, 1984 - June 30, 1985	66-2/3% of the old taxable sale value
July 1, 1985 and thereafter	50% of the old taxable sale value

Severance Tax on Metalliferous Minerals (Continued)

TAX RATE

During fiscal years 1980-81, 1981-82 and 1982-83, businesses that produced mineral products were permitted to claim a tax credit against the Special Excise Tax for Education. The tax credit was determined by formula (see "TAX CREDIT" under "SPECIAL EXCISE TAX FOR EDUCATION"). The tax credit could not exceed the taxpayer's Special Excise Tax liability for the year. However, if a taxpayer had an unused amount of credit for any year in which his production was curtailed due to economic conditions, the unused credit could be carried forward for a period not to exceed three years. Since the Special Excise Tax does not apply to metalliferous minerals after December 31, 1982, businesses that produce metalliferous minerals are authorized to claim this tax credit against their severance tax liability, beginning in 1983. In 1982-83, the amount of credit claimed may not exceed 40 percent of the taxpayer's severance tax liability. (Laws of 1982, Chapter 228, Section 2; Laws of 1982, Chapter 230, Section 15)

DUE DATE

Collections from the severance tax on metalliferous minerals are due on the twentieth day of the month following the month in which the tax accrues. Taxes are delinquent if they are not received by the Department of Revenue on the day preceding the last day of the month in which they are due. The due date may be extended by the Department of Revenue for good cause, but not beyond the first day of the third month following the regular due date. (42-1465, 42-1322)

COLLECTING AGENCY

Department of Revenue. (42-1462, 42-101)

DEDICATION OR PURPOSE

To aid in defraying the necessary and ordinary expenses of the state, cities, and counties, to reduce or eliminate the annual tax levy on property for state, city and county purposes and to reduce the levy on property for public school education. (Laws of 1982, Chapter 230, Section 17)

YIELD

No monies will be collected from this tax until fiscal year 1982-83.

DISTRIBUTION

Each year, a portion of severance tax collections will be distributed in the same manner as the transaction privilege tax (i.e. 25 percent to the cities, 33.6 percent to the counties and 41.4 percent to the state). The portion of collections that is distributed in this manner will increase each fiscal year until 1986-87. The table below shows the amount of severance tax collections that will be distributed in the same manner as transaction privilege taxes during each fiscal year. (42-1465, Laws of 1982, Chapter 230, Section 16)

Severance Tax on Metalliferous Minerals (Continued)

<u>period during which collections are received</u>	<u>portion of severance tax collections distributed in the same manner as the transaction privilege tax</u>
January 1, 1983 - June 30, 1983	40%
July 1, 1983 - June 30, 1984	48%
July 1, 1984 - June 30, 1985	60%
July 1, 1985 and thereafter	80%

After making this distribution, the balance of severance tax collections will be deposited each year in the state's general fund and is appropriated for public educational purposes. (42-1465; Laws of 1982, Chapter 230, Section 16)

INVENTORY TAX ON METALLIFEROUS MINERALS

BACKGROUND

Laws of 1982, Chapter 230, Section 13 established an inventory tax on metalliferous minerals. The tax was to be imposed on each producer's 1982 year end inventory of mined metallic products. In determining the tax, producers were allowed to deduct the value of any inventory which had previously been taxed or was exempt from taxation under the sales tax laws of this state. The inventory tax was to be levied at a rate of 1-1/2 percent and was payable in twelve equal monthly installments. The first installment was to be paid to the Department of Revenue on or before March 6, 1983. Taxpayers who were not mining in January of 1983 could be granted a one month extension for each month after December that the mine did not produce. The due date for the first monthly installment could not, however, be extended for more than six months. Under the provisions of this law, 40 percent of collections from the inventory tax was to be distributed in the same manner as the transaction privilege tax. The remaining collections were deposited directly into the general fund. (effective from and after December 31, 1982)

LEGAL CITATION

See Session Laws of 1982, Chapter 230, Section 13.

PAID BY

Persons engaged in the business of extracting substances from the earth that become metalliferous minerals (Laws of 1982, Chapter 230, Section 13, 42-1461).

EXEMPTIONS

None.

TAX BASE

The Inventory Tax is levied on the "net severance base" of the 1982 year-end inventory of all metalliferous minerals in this state. The net severance base is determined as follows:

1. Calculate the gross value of production for all metallic products in the 1982 year-end inventory. The gross value of production is determined by multiplying the recoverable units of a metallic product by the per unit price of the product; the price per unit does not include the cost of manufacturing, fabricating or otherwise transforming a refined mineral product, when these activities occur prior to sale of the product.
2. Subtract the out-of-state processing costs from the gross value of production for all metallic products in the 1982 year-end inventory. Out-of-state processing costs means processing costs incurred by the taxpayer out of this state, including freight charges for shipping metallic products out of state.

Inventory Tax on Metalliferous Minerals (Continued)

3. From the difference determined in step #2, deduct the value of metallic products that were previously taxed or were exempt from taxation under the sales tax laws of this state.

(Laws of 1982, Chapter 230, Section 13; 42-1461)

TAX RATE

Two and one-half percent of the net severance base. (Laws of 1982, Chapter 230, Section 13)

TAX CREDIT

During fiscal years 1980-81, 1981-82 and 1982-83, businesses that produced mineral products were permitted to claim a tax credit against the Special Excise Tax for Education. The tax credit was determined by formula (see "TAX CREDIT" under "SPECIAL EXCISE TAX FOR EDUCATION"). Since the Special Excise Tax does not apply to metalliferous minerals after December 31, 1982, businesses that produce metalliferous minerals are authorized to claim this tax credit against their inventory tax liability, for the remainder of the 1982-83 fiscal year. The amount claimed may not exceed 40 percent of the taxpayer's inventory tax liability. (Laws of 1982, Chapter 230, Section 15)

DUE DATE

Collections from the inventory tax on metalliferous minerals are payable in twelve equal monthly installments, with the first installment due on or before March 6, 1983. If a taxpayer was not mining in the month of January 1983, the Department is required to grant a one month extension of the date when the first monthly installment is due. For each subsequent consecutive month that a taxpayer does not mine, the Department is required to grant an additional one month extension. In no event shall the due date for the first monthly installment be extended for more than six months. (Laws of 1982, Chapter 230, Section 13)

COLLECTING AGENCY

Department of Revenue. (Laws of 1982, Chapter 230, Section 13)

DEDICATION OR PURPOSE

To aid in defraying the necessary and ordinary expenses of the state, cities and counties, to reduce or eliminate the annual tax levy on property for state, city and county purposes and to reduce the levy on property for public school education. (Laws of 1982, Chapter 230, Section 17)

YIELD

No monies will be collected from this tax until fiscal year 1982-83.

DISTRIBUTION

Of the total amount collected from the inventory tax on metalliferous minerals, 40 percent is to be distributed in the same manner as the transaction privilege tax and the balance is to be deposited in the state general fund. (Laws of 1982, Chapter 230, Section 16)

TABLE VII

- 1/ Acid soluble copper
- 2/ Sulfide copper .
- 3/ Included ANAMAX share of Palo Verde deposit for 1979-1982.
- 4/ Copper bearing silica flux mined 1971-1972.
- 5/ Grade reported for Kennecott's Ray mine is an average of oxide and sulfide together for 1977 to 1982.
- 6/ The Lakeshore mine was owned and operated by the Hecla Mining Company in 1976 and 1977.
- 7/ Weighted average grade of ore milled, based generally on an assay of total copper.

- 1/ Recoveries are based on available reported production and average grade of material treated. A number of oxide operations are not listed because of inadequate data.
- 2/ Percent recovery of acid soluble copper.
- 3/ Percent recovery in flotation-concentration treatment, after ore has been leached for 1971-1979.
- 4/ Percent recovery of sulfide copper.
- 5/ Recovery includes ANAMAX's share of Palo Verde 1979-1981-1982.
- 6/ Recovery by leaching heaps continued after mining was terminated in July 1981.

Source: "Minerals Yearbook - Area Reports: Domestic", U.S. Bureau of Mines; Company Annual Reports: EMJ International Directory of Mining and Mineral Processing Operations; Arizona Department of Mineral Resources; Company submitted data for 1982.

- 1/ Leachable rock included with waste (except at solely leach operations).
- 2/ Includes preproduction stripping.
- 3/ Stripping continued as sulfide concentrator was shut down from March 1975 to January 1976.
- 4/ Without Twin Buttes the ratio would be 1.89:1
- 5/ Mining is done by ASARCO, includes ANAMAX's share of ore.
- 6/ Stripping of overburden ceased in January but mining continued until July.
- 7/ Not used in calculation of weighted average.
- 8/ No stripping in 1982.

*NOTE: These are now weighted averages so use caution in making comparisons to the averages presented in previous editions of this report.

-Continued-

Source: "Minerals Yearbook - Area Reports; Domestic 1982", U.S. Bureau of Mines (Preliminary Data)

W Withheld to avoid disclosing company proprietary data.

1/ Data will not add to total shown because some mines produce more than one class of material. Operations from which metals are recovered only from tailings or precipitates are not counted as producing mines.

2/ Includes material that was leached.

3/ Includes columnar data indicated by symbol "W" to avoid disclosing company proprietary data.

4/ Includes copper recovered from precipitates of ore leached.

5/ Does not include copper from lead ore.

6/ Combined to avoid disclosing company proprietary data.

7/ Data may not add to totals shown because of independent rounding.

TOTAL		1,248,500
=====		

Source: Arizona Department of Mineral Resources file data; Company Annual Reports and Form 10-K; Professional Publications.

^{1/} Figures generally represent a current estimate of the productive capacity of primary recoverable copper in concentrates, precipitates, and cathodes. Figures do not represent smelter or refinery capacity. The estimates are based on recent production figures and on capacities of concentrator and leach plant facilities. Other factors affecting actual production include, for example, grade of ore and recovery. Some capacities have been published by the reporting company.

^{2/} Includes approximately 33,000 tons of copper concentrated annually from ore obtained at the Eisenhower mine.

^{3/} The Mission mill treats ore from the Mission, San Xavier and ASARCO's share of Eisenhower mine production.

TABLE XIV

Source: This report, Table XV "Minerals Yearbook - Area Reports; Domestic", U.S. Bureau of Mines.

1/ "Covered Employment" by law includes all employees of employers of three or more persons. Since the "Average Number of Covered Employees" in this table generally includes practically all workers in copper mining and processing (see Table XIII), the number of employees is greater than the number tabulated under "All Employees" in Table XIV. Prior to 1966 only a portion of the workers in smelting refining, and rod fabrication were included in this table; the rest of the end-processing workers were separated and classified under "Manufacturing" in Table XIII.

2/ Mine production in short tons of lode ore from "Arizona, Mine Production by Class of Ore", reported by the U.S. Bureau of Mines. In 1972 and thereafter the tonnage may include copper-zinc, copper-lead and lead-zinc ore combined to avoid disclosing individual company confidential data. Data is preliminary for 1981.

TABLE XVII CONTINUED
EMPLOYMENT, EARNINGS AND HOURS IN COPPER MINING
IN THE UNITED STATES AND ARIZONA 1/

- 1/ Statistics do not reflect workers in copper smelting, refining and rod fabrication.
- 2/ These figures are estimates made by the Arizona Department of Economic Security, in cooperation with the U.S. Bureau of Labor Statistics, and they include all full and part-time wage and salary workers who were employed in copper mining in any part of the pay periods which included the 12th of each month of the year.
- 3/ Estimates made by the U.S. Bureau of Labor Statistics, in cooperation with the 50 states, and based upon monthly samplings similar to those in 2/ above, adjusted periodically to census bench marks.
- 4/ Estimates of production (non-supervisory) workers based upon samplings as in 2/ above. Since 1975, figures have been calculated by the Arizona Department of Mineral Resources dividing the annual number of "All Employees - Arizona" by a factor of 1.26. This factor was derived by comparing the annual number of "All Employees - Arizona" with "Production Workers - Arizona" from 1970 to 1974.
- 5/ Earnings figures for a particular year is the product of "Average Hourly Earnings" and "Average Weekly Hours" for that year.
- 6/ Gross payroll aggregates, exclusive of irregular bonuses and other pay not earned in a sample pay period, are divided by gross man-hour aggregates of production and related workers for the period in order to determine average hourly earnings.
- 7/ "Average Weekly Earnings" times 52 weeks.
- 8/ Number of production workers times "Average Weekly Hours" times 52 weeks.
- 9/ Copper ore mined includes ore shipped directly to smelters, treated by concentration, and ore leached in heaps, vats or tanks.
- 10/ Copper produced includes recoverable copper from copper ore (see 9/) and from copper precipitates and cathodes produced from dump and in-place leaching.

UNITED STATES GOVERNMENT & U.S. METALS CORP.	Apex	Mixed (?)			
VAN DYKE COPPER CO. & SHO-ME COPPER CO.	Van Dyke	Oxide	100	0.50	Published 1977.

1/ Reserves are given with a grade of average total copper content as of December 31, 1982, unless stated otherwise under "Remarks". As used in this table, reserves generally mean those estimated quantities of ore which, under presently and reasonably foreseen technical and economic conditions may be profitably mined and sold or processed for the extraction of their constituent values.
